

Claims:

What is claimed is:

An adjustable mount for securing marine equipment comprising:

1. C-extrusion (a hollow c-shaped cylindrical extrusion of material) having an empty interior cavity and ridges along entire inside surface.
2. The ridges within the C-extrusion from end to end along the internal cavity of the C-extrusion.
3. The C-extrusion is a hollow cylindrical tube is made of extruded aluminum.
4. Slide brackets comprised of t-shaped extrusions of material with circular C-shaped bases with a single ridge on the bottom and a set screw on the top of the base.
5. The adjustable aspect of the slide brackets wherein the slide brackets adjust sideways and slide through the entire length of the C-extrusion cavity.
6. The adjustable aspect of the slide brackets wherein the slide brackets adjust up or down within the cavity of the C-extrusion.
7. A single ridge on the base of the slide bracket for the purpose of retaining a particular position within the C-extrusion.
8. The function of the setscrew within the base of the slide bracket to expand or contract the base and prevent or allow movement of the slide bracket.
9. A setscrew through the C-shaped base of the slide bracket for the purpose of securing the slide bracket within the C-extrusion and along the ridges.
10. The T-shape face of the slide bracket which enables the attachment of the rod holders and also other accessories which may be offered.
11. End pieces, a locking solid round bar in each end of C-extrusion of material.

12. End pieces, locking solid round bar in each end of the C-extrusion as a means of attaching the C-extrusion to a mounting bracket, including a plurality of screws for fastening the end-piece to the ends of the C-extrusion.
13. The dual adjustment feature of the locking end-piece where one flat screw in the end of the C-extrusion locks against the end-piece affixing the universal assembly in place up or down, and a set screw which locks the end-piece against the mounting bracket to further adjust the universal mount assembly up or down.
14. The set screw in the end of the end-piece which locks the mounting bracket in a position up or down.
15. The flat screw in the end of the C-extrusion which locks against the end-piece to adjust the universal mount assembly up or down.
16. Mounting brackets comprised of flat segments of material bending along a line into two planes perpendicular to each other resulting in an L-shape when viewed head on for the purpose of securing the C-extrusion to an auto or marine vehicle.
17. The method of attaching the mounting bracket to an end-piece for adjustment, i.e. a bracket affixed by a set screw to an end-piece (solid round bar).
18. The locking aspect of the ridges inside the C-extrusion when the single ridge of the slide bracket is tightened against the C-extrusion ridges.
19. The set screw mechanism in the base of the slide bracket which expands to tighten the single ridge of the slide bracket against the ridges of the C-extrusion.
bracket is secured by tightening a setscrew within the c-shape base of the slide bracket.
20. The function of the single ridge on the base of the slide bracket.
